

The adaptive spin budget tracks the arrival process online

Learned per-consumer from inter-arrival gaps that shift mid-run — nothing here is a configured constant

Raw data: `results/adaptive_trace.csv` (`scripts/adaptive_trace.sh`, `bench/adaptive_trace.c`). Single run, one consumer, unquieted machine — a policy-shape demonstration, not a quoted latency claim. Fixed-budget line: this trace's own median S over the back half of phase 1, held flat.
